

Translating Q1 2023 Transaction Data into Menu Optimization and Hoanior

An executive review of \$159.2K in gross revenue to identify SKU rationalization targets and operational bottlenecks.

Italian

Asian

Mexican

American

Total Revenue

\$159,217.90

Across 5,370 completed orders

Average Order Value (AOV)

\$29.65

Average Item Price

\$13.16

Total Items Sold

12,097

Monthly Run Rate

Data Hygiene Note: 137 records in order_details contain a null item_id and generated \$0.00 in recorded revenue; these have been excluded from average calculations.

The Three Strategic Pillars

1. Category Dynamics

Analyzing the revenue-volume disparity between the Italian/Asian duopoly and trailing cuisines.

2. Product Polarization

Identifying portfolio winners, volume anchors, and specific SKU rationalization targets.

3. Operational Rhythms

Mapping the intense bimodal daily demand and its direct impact on kitchen throughput.

The Revenue vs. Volume Disparity

The Duopoly Effect

Italian and Asian cuisines drive over 60% of total revenue, but their paths to profitability differ dramatically.

Divergent Growth Models: Price vs. Velocity

The Italian Premium

- Italian drives maximum top-line revenue (\$49,462.70) primarily through pricing power.
- The average item price is the highest in the portfolio at \$16.78.
- Requires significantly lower kitchen unit volume (2,948 items) to reach targets.

The Asian Engine

- Asian drives absolute operational volume (3,470 items sold—522 more than Italian).
- The category compensates for a moderate average item price (\$13.46) through sheer velocity.
- Secures \$46,720.65 in revenue through high turnover and rapid ticket times.

Structural Margin Ceilings

Average Item Price

The Margin Lag

Mexican (\$34.7K Rev, 21.9% share) and American (\$28.2K Rev, 17.7% share) generate substantial kitchen volume (over 5,600 combined units) but severely lag in revenue contribution purely due to structural price ceilings.

Menu Engineering Matrix: Q1 Portfolio Diagnostic

The MVP Showcase

KOREAN BEEF BOWL

\$10,554.60

Total Revenue

588

Units Sold

\$17.95

Unit Price

The ultimate portfolio MVP. It perfectly marries the high velocity of the Asian Engine with the premium pricing usually reserved for the Italian category, generating 6.6% of the restaurant's total top-line revenue from a single SKU.

The Volume Anchors (Plowhorses)

Hamburger - 622 Units Sold

\$8,054.90 Rev
(\$12.95 Price)

Edamame - 620 Units Sold

Moderate price
limits ceiling

Cheeseburger - 583 Units Sold

\$8,132.85 Rev
(\$13.95 Price)

Effort-to-Reward Gap

These items drive basket size and kitchen activity but inherently limit gross revenue compared to premium entrees due to their \$12-\$14 price ceilings.

SKU Rationalization Targets

Menu Item	Category	Unit Price	Units	Total Revenue
Chicken Tacos	Mexican	\$11.95	123	\$1,469.85
Potstickers	Asian	\$9.00	205	\$1,845.00
Chips & Guacamole	Mexican	\$9.00	237	\$2,133.00
Hot Dog	American	\$9.00	257	\$2,313.00
Cheese Quesadillas	Mexican	\$10.50	233	\$2,446.50

The Bottom 5

Four of the bottom five revenue items are priced under \$11.00. The Mexican appetizer and taco tier suffers from a fatal combination of low order volume and low margin.

The Daily Heartbeat: Bimodal Demand

Order traffic and revenue do not flow evenly. The data reveals a pronounced bimodal daily cycle, strictly defining the windows for required kitchen throughput capability.

Peak Anatomy: Lunch Rush vs. Dinner Service

The 48% Operational Window

48% of total daily business occurs in just 4 total operating hours.

Labor scheduling, prep-cook timing, and front-of-house staffing must be radically disproportionate to match this bimodal reality.

Kitchen throughput during these 240 minutes is the single greatest bottleneck to revenue growth.

The Convergence Insight

High-volume, low-price items (like Hamburgers and Edamame) hitting the kitchen precisely during the intense 4-hour rush creates maximum operational stress for minimum revenue return.

Every minute the line spends producing a \$1.4K-revenue Chicken Taco at 12:15 PM is capacity stolen from producing an \$18, high-margin Korean Beef Bowl during peak demand.

Strategic Imperatives

1. Streamline (Cut)

Consolidate or entirely cut the underperforming Mexican SKU tier. Specifically target Chicken Tacos and Cheese Quesadillas to remove low-margin complexity from the line.

2. Optimize (Labor)

Abandon flat labor schedules. Align maximum prep-cook capacity and line staffing explicitly for 11:30 AM and 4:30 PM to ensure zero friction during the 48% revenue spikes.

3. Engineer (Menu)

Premiumize the American volume anchors. Given the massive unit volume of Hamburgers (622 units), introducing slight premium variations will bridge the revenue gap with the Italian and Asian categories.
